

Menu choice 1:

Run the program to start. Then the output will be a menu with 4 choices. If you want to enter a stat, hit 1. Then enter the initial of the player. It is not case sensitive. Enter a statistic category (ie. shooting, rebounding). This one is case sensitive though. Then enter the specific statistic you want to enter (ie. 3PC or OR). Then enter the number of times that player achieved the specific statistic you entered during the game. Then it resets back to the original menu.

Menu Choice 2:

If you want to print a specific player, choose the second option in the menu. Then enter the player's initials not case sensitive. Enter a stat category (case sensitive). Then it will print the point values for each statistic for you.

Menu Choice 3: For this choose a specific category (case sensitive) and it will print the point values for each statistic for each player.

Menu Choice 4:

The last option in the menu, exit, just exits the program and updates the csv files. If you want to use the program again, you have to re-run it.

How to run program: To start download the latest version of python on your computer. It will probably be python 3.7. Download the python file. Then go to your terminal and type: `python3 ~/your mac username/downloads/Main.py`

Your mac username is whatever you chose. Mine is adamepstein
